

Go to the **Call** tab.

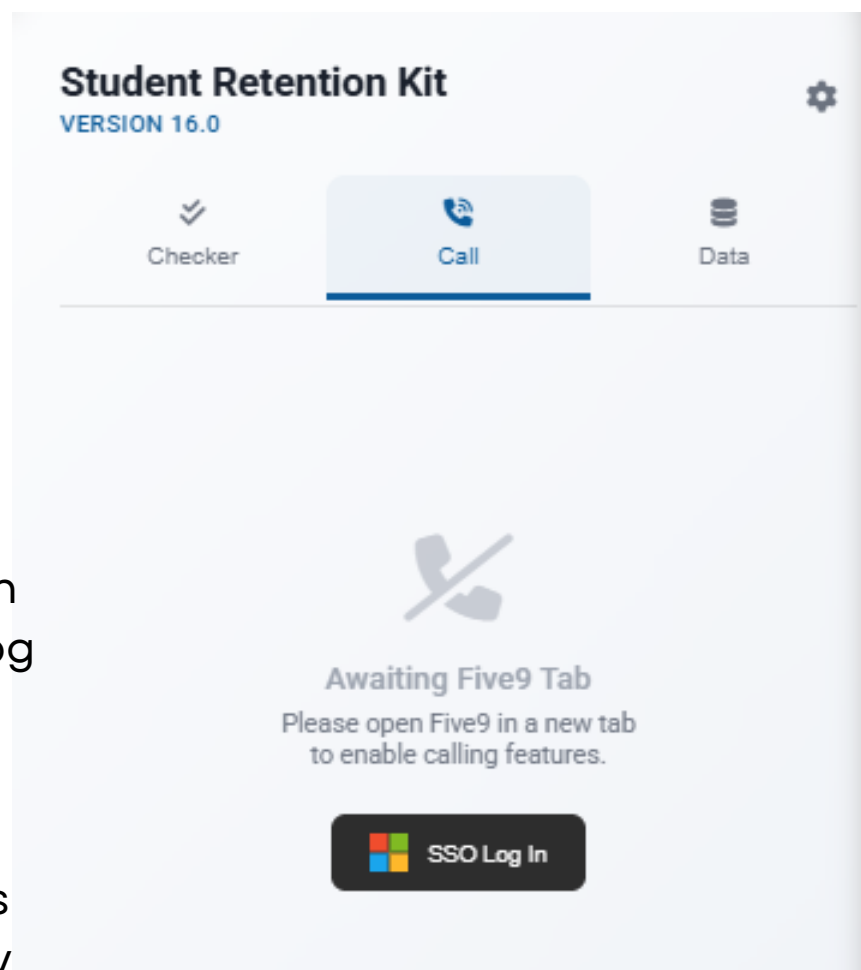

This integrates with your **Five9** application. If you don't have Five9 open, simply click the SSO Log In button to automatically log in to Five9.

The purpose of this tool is to facilitate the efficiency of your calls.

There are two modes:

Default - Normal dialing process

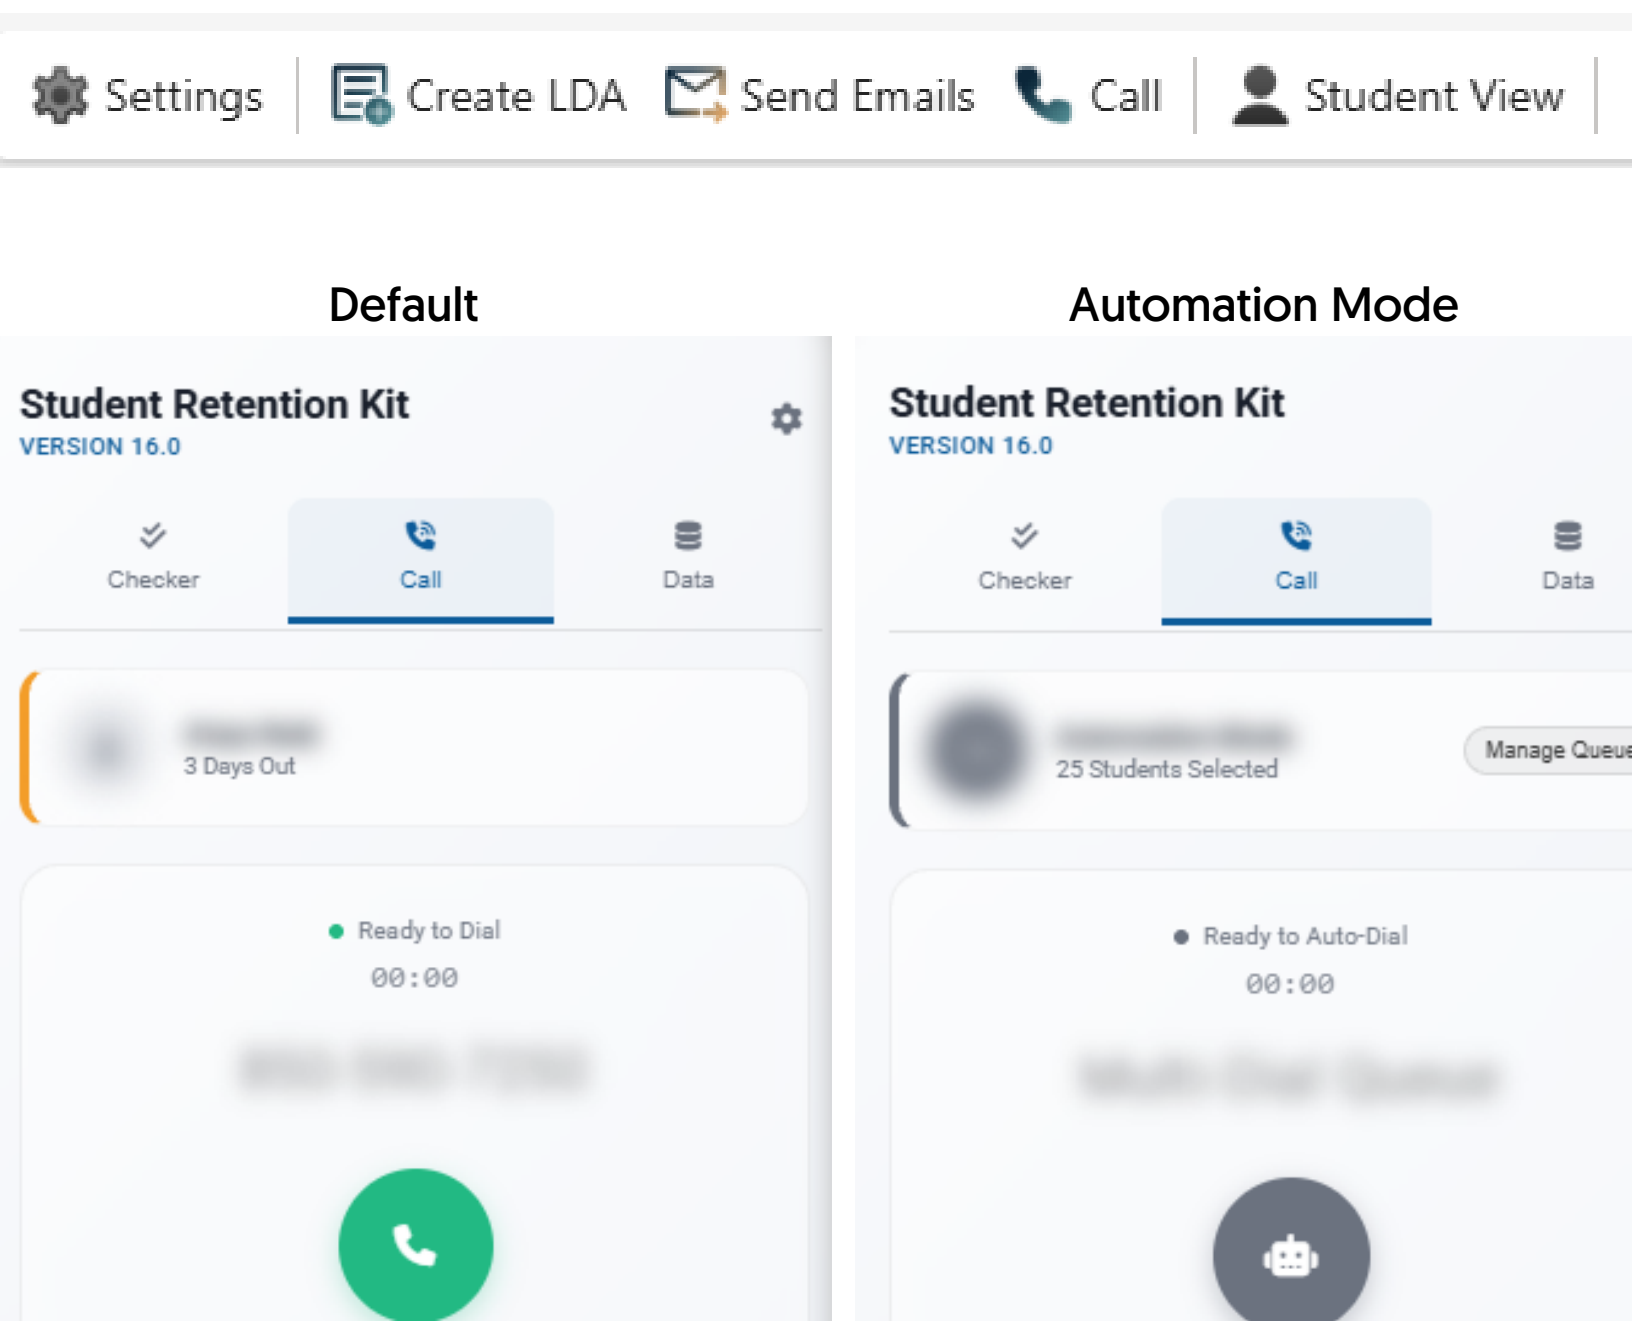

Automation Mode - A queue of students that get auto-dialed one after the other immediately upon ending the call.

The application tracks where you have your current selection on the sheet. If you're selection is on row 2 then it will mark that student's row to call. If you select multiple rows then it will group the students for a call automation.

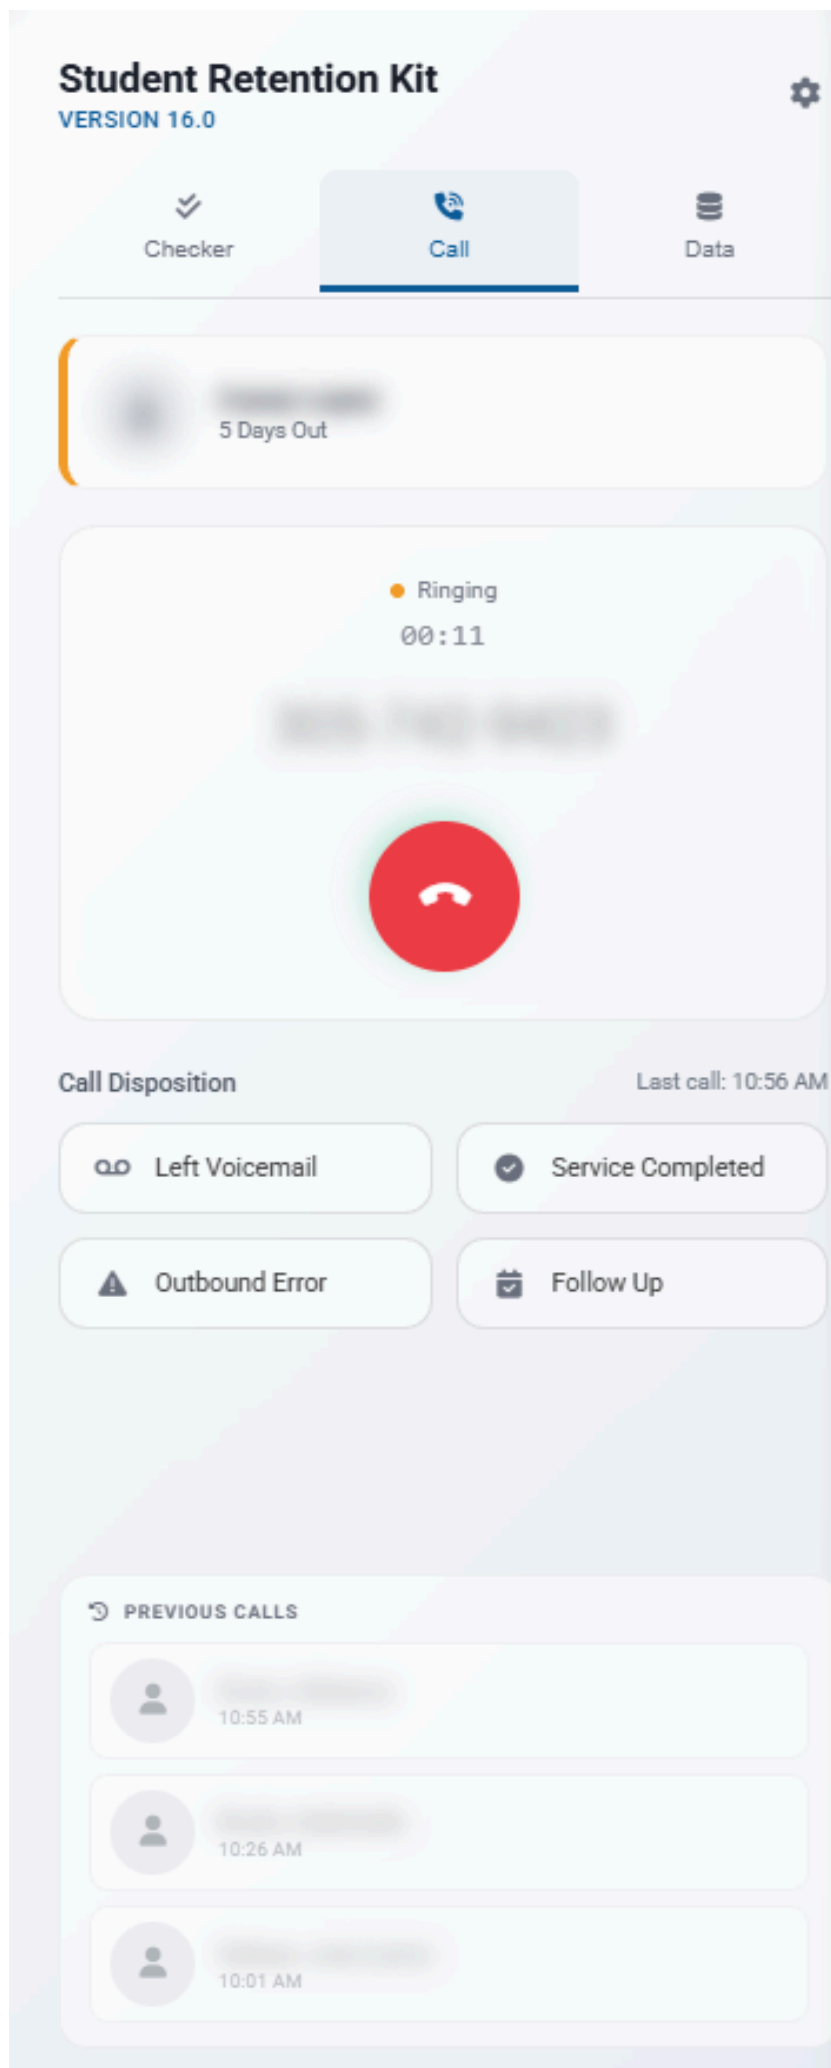

There are two ways to make calls from your excel sheet:

1. Click the **Call** button
2. Click on **Student View** and it will track your row selections

This is what it looks like when you make a call with a student. You can either click the **End Call** button or set a disposition to conclude your call. By setting the disposition first, the call will end automatically.

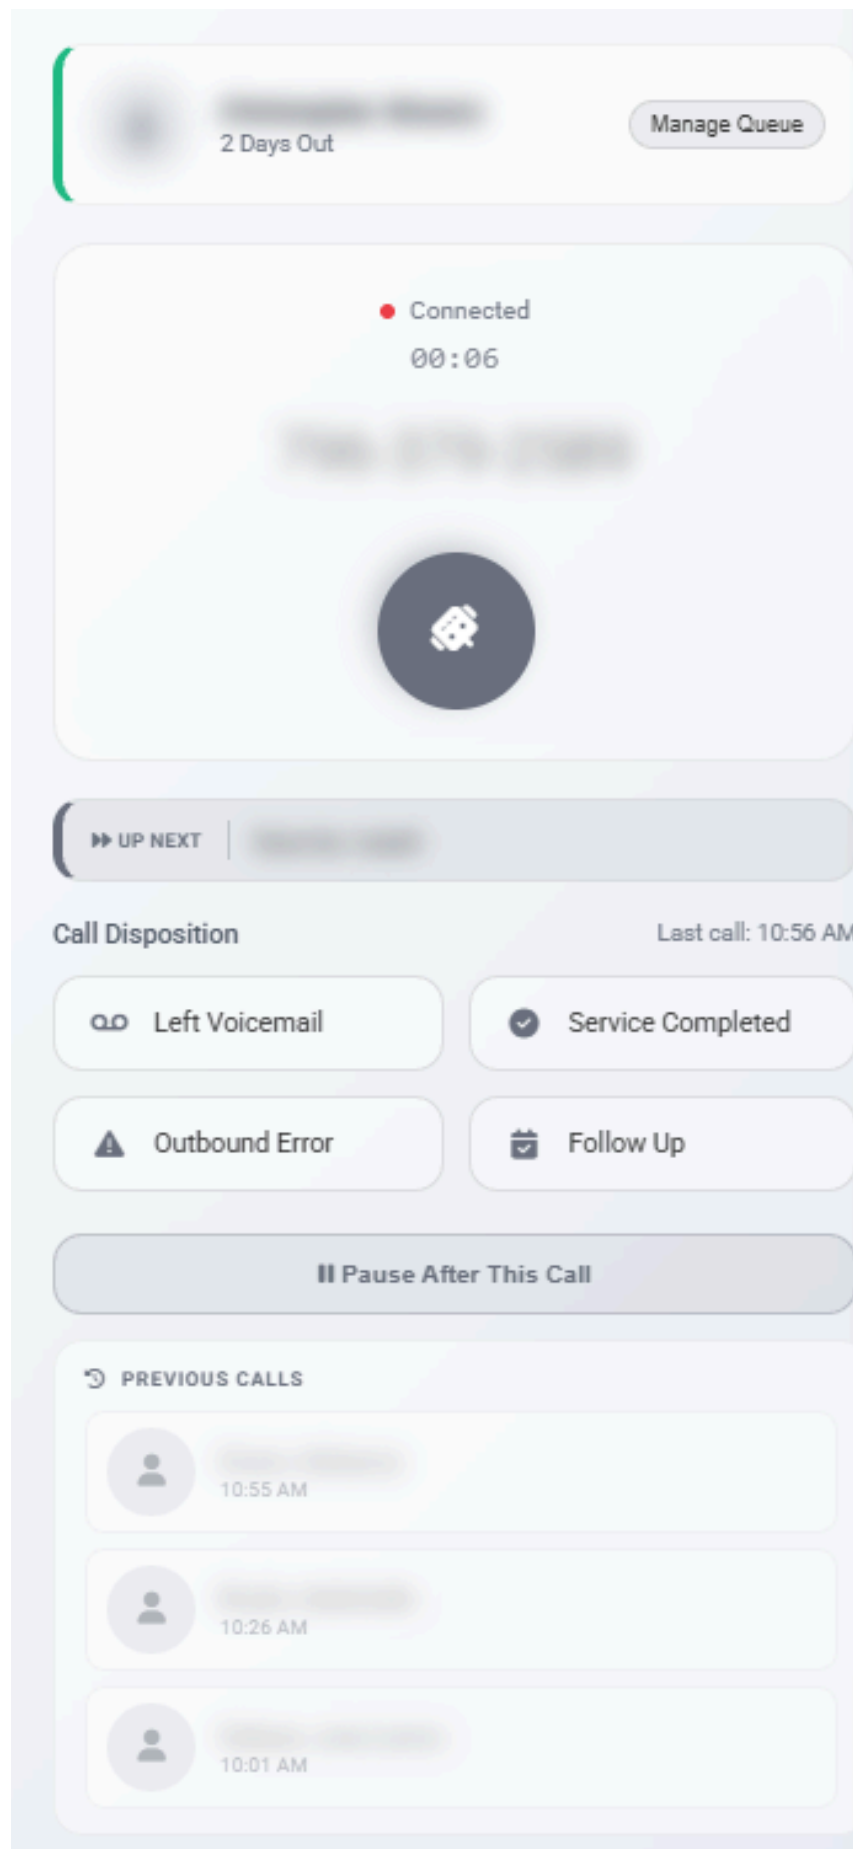

Here is a list of previous calls in case you want to quickly redial a student you have contacted before.

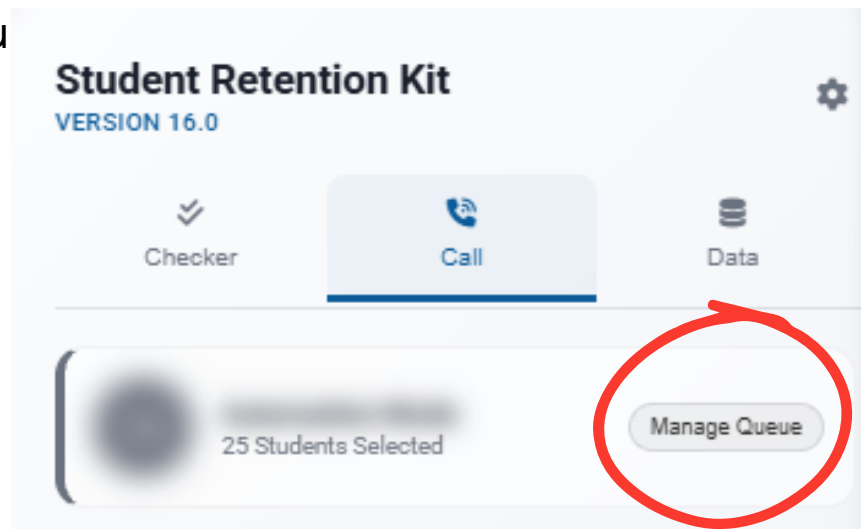

This is the call automation version. Clicking the **Gray Robot button** will end the automation.

You can also see who is queued next in your calls.

Notice the **Pause After This Call** button; the can be used to take a break during the automation process.

For automation mode, you can click on **Manage Queue** to adjust the order of students you call.

Simply click and drag. You can also remove students from the queue.
